

Engineering

Development and realisation of technical equipment

The engineering department deals with the development and realisation of technical equipment, in particular in terms of operating ergonomics and production optimization. The requirements in the development process are constantly increasing. To meet these requirements, we focus and rely on future-oriented technologies and through this, we ensure long-term and sustainable success. Furthermore, we have spacious production and storage areas available.

Prototype manufacturing & customised products

We will gladly not only assist you in the development of prototypes but also continue to support you in the serial production that follows. Benefit from our wealth of experience in customised production of individual parts as well as in jig and prototype manufacturing and save time as well as reduce costs. Planning and production are always possible, even with customer-specific materials and component parts.

Container management (refurbishment)

Reducing waste and preserving resources and the environment is one of the biggest challenges we face today. Containers, e.g. for transportation, must regularly undergo a high quality inspection and servicing.

Save time and reduce cost whilst considering the environment

For the purpose of reuse, we therefore not only inspect the containers used by you but also offer innovative ideas for improvement. Our open and warehouse spaces are ideal for storing, revising and for returning your products. Furthermore, we support you in the prototype manufacturing process, construction of new containers and carry out approval tests.
